

Consuming 3rd Party Services

To assist in your research and
development work

Agenda

- On-demand “machine learning”
- Complementing our research and development
- Microsoft Cognitive Services
 - Signing Up
 - Image Analysis
 - Text Analytics with Python
 - Web Language Model with R

Introduction

- On-demand machine learning
 - Google's Prediction API (2012)
 - Microsoft's Cortana Intelligence Suite (2015)
 - Amazon's Machine Learning (2015)

On-Demand Machine Learning

- ✓ No need to know complex AI algorithms.
- ✓ Some programming needed.
- ✓ No installation of software, calls are generally via RESTful interface.

Complementing R&D

- A small part of a big picture!
- Typically, you spend a lot of time to prepare your data.

Preparing Data

- Can involve, for example
 - Filtering for language
 - Selecting specific images
 - Named entity or keyword extraction

Analyze an image

This feature returns information about visual content found in an image. Use tagging, descriptions and domain-specific models to identify content and label it with confidence. Apply the adult/racy settings to enable automated restriction of adult content. Identify image types and color schemes in pictures.

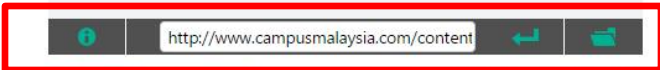

Please try vision feature analysis demo by uploading a local image, or providing an image URL. We don't keep your images for this demo unless you give us permission.

Is Adult Content: False

Detect Language

The API returns the detected language and a numeric score between 0 and 1. Scores close to 1 indicate 100% certainty that the identified language is true. A total of 120 languages are supported.

Entity Linkage (Python)

The screenshot displays the PyCharm IDE interface. The main editor window shows the file `entityMCS.py` with the following Python code:

```
# Ian Tan, Copyright (c) 2016
# Data Science Institute, Multimedia University

# Sample code taken from MCS site
import httpplib
import urllib
import base64

headers = {
    # Request headers
    'Content-Type': 'text/plain',
    'Ocp-Apim-Subscription-Key': '9a94194d653b4eb09d71677872015565',
}

params = urllib.urlencode({
    # Request parameters
    'selection': '',
    'offset': '',
})

try:
    conn = httpplib.HTTPSConnection('api.projectoxford.ai')
    conn.request("POST", "/entitylinking/v1.0/link?%s" % params, "Jln Cheras, expect delays from Taman Connaught - the Billion roundabout", headers)
    response = conn.getresponse()
    data = response.read()
    print(data)
    conn.close()
except Exception as e:
    print("[Errno {0}] {1}".format(e.errno, e.strerror))
```

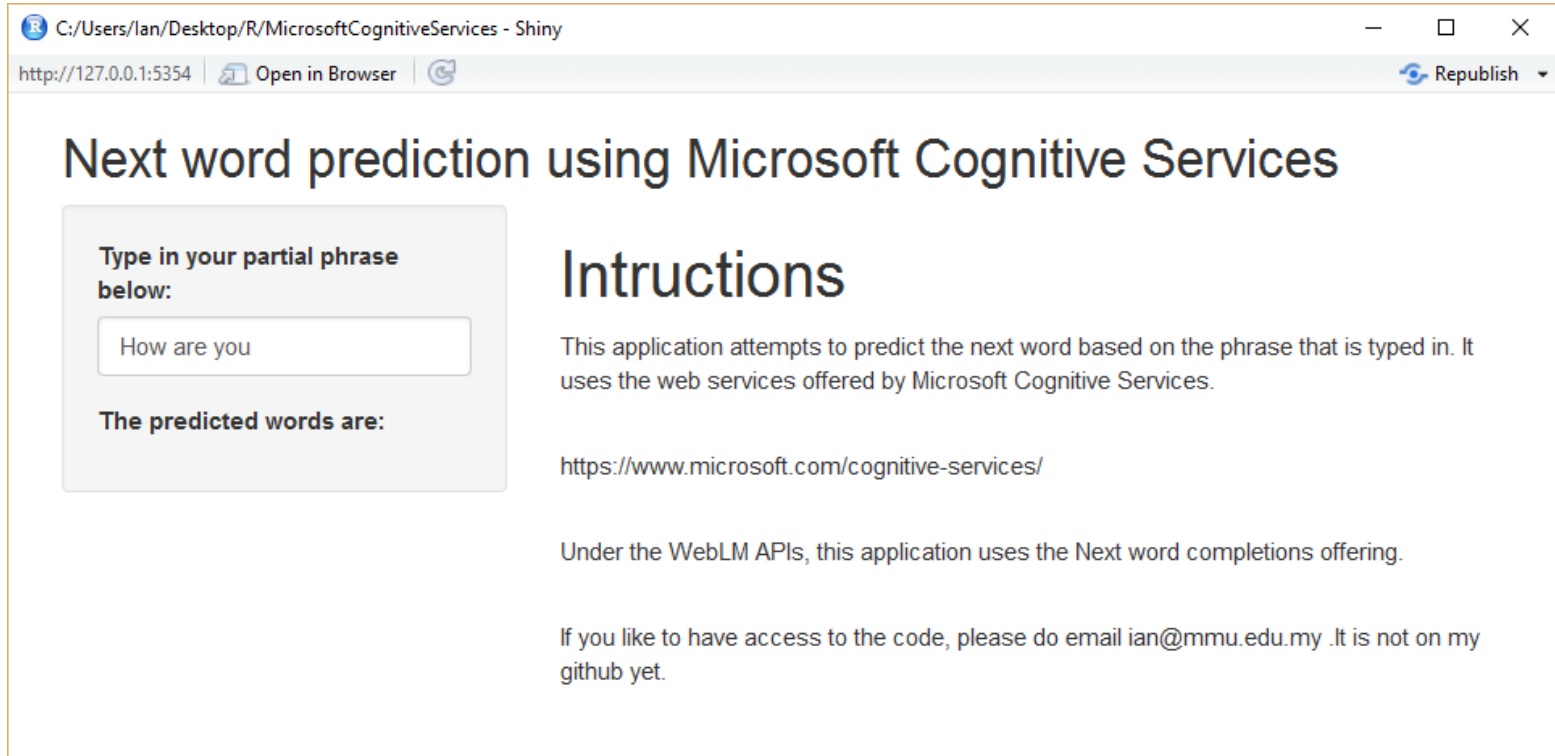

The left sidebar shows the project structure for "Topic Modeling with MCS", including files like `convertCSV2JSON.py`, `entityMCS.py`, `soya_2016Feb.csv`, `soya_2016Feb.json`, `soya_2016Feb.txt`, `soya_2016Feb-Results.txt`, and `topicMCS.py`.

The bottom panel shows the Run output for `topicMCS.py`:

```
C:\Python27\pythonw.exe "C:\Users\Ian\Desktop\Topic Modeling with MCS\entityMCS.py"
[Errno 11001] getaddrinfo failed
Process finished with exit code 0
```

The Windows taskbar at the bottom indicates the date and time as Friday, June 3, 2016, at 4:33 PM.

Next Word Prediction (R)

The screenshot shows a web browser window with the address bar displaying 'http://127.0.0.1:5354'. The browser title is 'C:/Users/lan/Desktop/R/MicrosoftCognitiveServices - Shiny'. The page has a 'Republish' button in the top right corner. The main heading is 'Next word prediction using Microsoft Cognitive Services'. On the left, there is a light gray box containing the text 'Type in your partial phrase below:' above a text input field with the value 'How are you'. Below the input field, it says 'The predicted words are:'. On the right, the heading 'Instructions' is followed by a paragraph: 'This application attempts to predict the next word based on the phrase that is typed in. It uses the web services offered by Microsoft Cognitive Services.' Below this is a URL: 'https://www.microsoft.com/cognitive-services/'. Another paragraph states: 'Under the WebLM APIs, this application uses the Next word completions offering.' The final paragraph says: 'If you like to have access to the code, please do email ian@mmu.edu.my .It is not on my github yet.'

Next Word Prediction (R)

Ian Tan, Copyright (c) 2016

Data Science Institute, Multimedia University

```
library(httr)
library(jsonlite)
shinyServer(function(input, output) {
  output$predictedText <- renderText({
    # input$entry (or ngrams) should be preprocessed first actually.
    ngrams <- input$entry
    url <-
paste0('https://api.projectoxford.ai/text/weblm/v1.0/generateNextWords?model=body&words=',ngrams,'&order=5&maxNumOf
CandidatesReturned=5')
    url <- URLEncode(url)
    ans <- POST(url, body = NULL, add_headers("Ocp-Apim-Subscription-Key"="f8f16618074948828176ef9063ba06a0"))

    json_ans <- toJSON(content(ans, "parsed", "application/json"))
    next_words <- unlist(fromJSON(json_ans)[[1]][[1]])
  })
})
```

Concluding Remarks

- We can make use of tools to assist us in our research work. We don't have to reinvent the wheel.
- We can use these as a reference for comparison if we are working on the same area.
 - These tools are rather English centric and hence they have limitations in application to our context usually.
